Ch. 6: C Shell

- C shell supports all the core features discussed in Ch. 3 plus the following:
- * several ways to set and access variables
- * built-in programming language
- (conditional branching, looping etc.)
- * command customization using aliases
- access to previous commands using history mechanism
- advanced job control
- several new built-in and enhancements to existing commands

Startup

- The C shell is located in /bin/csh usually; it is a C program! When started as a login shell, the startup sequence is as follows: * Execute commands in \$HOME/.cshrc, if it exists
- * Then, execute commands in \$HOME/.login

/etc/login, if it exists

* Then, execute commands in global login initialization file

A sample .cshrc file

- The .cshrc file usually contains commands that set aliases or anything else that applies only to the current shell. (rc stands for run commands)

```
alias h history
alias 11 ls -1
alias ls ls -F
alias rm rm -i
```

The .login file usually contains commands to set the terminal, set environment variables, etc.

```
set notify
set prompt = "! % "
                                                                                                           set cdpath = (~)
                                                                                                                                          set path=(. /bin /usr/bin /usr/local/bin )
stty erase "^?" kill "^U" intr "^C" eof "^D" crt crterase
                                                                                                                                                                                                                                                                                   set termtype = $<</pre>
set savhist = 32
                                                                               set history = 40
                                                                                                                                                                                              unset termtype
                                                                                                                                                                                                                            if ("$ermtype" != "") set term = "$termtype"
                                                                                                                                                                                                                                                         set term = vt100
                                                                                                                                                                                                                                                                                                                     echo -n "Enter your terminal type (default is vt100): "
```

Variables

```
% set verb = sing
                                                                                                                                                                                                                                                                                                                                                                                                                                         ١
                                                                                                                                                                                                                     Two new access methods:
                                                                                                                                        (2) ${?name} ; replaced by 1 if name is set and 0 otherwise
                                                                                                                                                                     (1) ${name} ; use this if name immediately followed by string
                                    echo I like ${verb}ing
                                                                                                                                                                                                                                                                                                                                                                                                                                  Some examples:
                                                                                                                                                                                                                                                                                       set name = "Graham Glass"
                                                                                                                                                                                                                                                                                                                                                          set flag
                                                                                                                                                                                                                                                                                                                         set color = red
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             set name = value
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   # value could be a list within parentheses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       # if name = value is omitted, all variables are listed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       # if name is not specified, null string is assigned
I like singing
```

```
The following is a script illustrating the (2) access method set flag = abc if (${?flag}) then echo flag is set endif
```

List Variables

```
% set colors = ( red green blue )
% echo $colors[1]

red
% echo $colors[2-3]
green blue
% echo $colors[*]
 red green blue
% echo $#colors
```

Building lists:

```
% set colors[4] = yellow
                                                                                                                                                                                                                              % set colors = ( $colors pink )
                                                            set
                                                                                                                                                                                                                                                   set colors[4] = yellow # Not ok since [4] does not exists
                                                                                                                        echo $colors
                                                                                                                                                                                                           echo $colors

abcbcf
                                                       s2 = (b c f)
                                                                                                                                                                   # ok since [4] exists
                                                                                                                                           # forgot ()!
                                                                                                                         # sets only first value
```

Some Predefined local variables

The next line of standard input

\$argv A list containing all of the positional parameters;

argv[1] = \$1 etc.

\$cwd Shell's home directory Current working directory

\$home

\$noclobber

\$ignoreeof Prevents shell from terminating when CTRL-D is pressed

Prevents existing files from being overwritten by > and nonexisting files from being appended using >>

\$noglob Prevents wildcard expansion

\$path Used to locate executables (list of directories

extracted from PATH environment variable)

\$prompt The shell prompt

\$savehist Number of commands to save in the history file

\$shell Full path name of the login shell

\$status exit code of the last command

```
echo ho $name, your current directory is $cwd
                                                                                                                              set name = $<

String, Arithmetic and File-oriented Expressions

```
String expressions:
                          s1 !~ s2 Like != except rhs may contain wildcards
Note: if either side is a list, the first item is used
                                                                                                               s1 = s2
                                                                                                                                          s1 == s2
                                                                                     =~ s2
for comparison
                                                                                                                                    true if exactly equal
                                                                                                             true if unequal
                                                                             Like == except rhs may contain wildcards
```

```
#!/bin/csh
echo -n "do you like the C shell? "
set reply = $<
if ($reply == "yes") then
echo you entered yes
else if ($reply = y*) then
echo I assume you mean yes
else
echo not yes
endif</pre>
```

Arithmetic expressions (P 189 Table lists all operators) similar to C language

&, &&, |, ||, <, >, <<, >> operations must be surrounded by () so that they are not misinterpreted as shell operators

ex. if ((\$a > \$b) || (\$a <= \$c)) then

Do not use the set command to assign an expression to a variable Instead use the @ command as follows: (@ by itself lists all shell variables)

% @a = 2 * 2

, echo \$a

4

% @a += 1

echo \$a

ပာ

File-oriented Expressions:

-option fileName

```
Option
                                                                                                                                                                                                                                                                                                                           Meaning
                                                                                                                                                                                                            Shell has execute permission for fileName
                                                                                                                                                                                                                                                Shell has write permission for fileName
                                                                                                                                                                                                                                                                                     Shell has read permission for fileName
fileName is a directory
                                  fileName is a regular file (not dir, special)
                                                                       fileName exists and is 0 bytes in size
                                                                                                       of the shell process
                                                                                                                                         fileName is owned by the same user as that
                                                                                                                                                                               fileName exists
```

The following is a script called 63.csh

% 63.csh endif else echo -n "Enter name of file you wish to erase: "
set fileName = \$< rm \$fileName echo you do not have permission to erase the if (! (-w \$fileName)) then #!/bin/csh Enter name of file you wish to erase: /

you do not have permission to erase the file

Filename completion

% set filec

- after setting filec, you do not have to type the entire file names otherwise type * to view all matching files if a unique match exists, the file name is automatically completed instead you may type esc key after initial few letters
- In tcsh the shell displays all matching files when esc is pressed

Aliases

- alias word string
- unalias pattern

Some useful aliases:

alias ls ls -F
alias rm rm -i
alias h history
alias c clear
alias ls-l ls -l
alias ll ls -l
alias dir ls

History Mechanism

- keyboard; These can be recalled, edited, and executed at a later The C shell keeps a record of the commands entered from the stage. The meta character ! gives access to the history of commands.
- Numbered commands:

set prompt = '\! % ' # set prompt to include command/event number

*

% set history = 40

remember last 40 commands

% set savehist = 32

save last 32 commands between sessions

% alias h history

h is an alias for history which lists
the history

Command Reexecution:

```
!?substring? replaced with text of the most recent command
                                                                                                                                     !num
                                                                                                  !prefix
                                                                                                 replaced with the most recent command which
containing substring
                                                                                                                                   replaced with text of command numbered num
                                                                                                                                                                 replaced with text of last command
                                                                 started with prefix
```

Accessing pieces of a previous command: (These modifiers can be placed immediately after event specifier)

```
echo I like horseback riding
                                                       50 % echo !48:1-$
                                                                                                            echo I like riding
I like horseback riding
                                                                                                                                          49 % !!:0 !!:1 !!:2 !!:4
                                                                                    I like riding
                                                                                                                                                                        48 % echo I like horseback riding
                                                                                                                                                                                                                                                                                                                                                   :number
                                                                                                                                                                                                                                                                                                                      :start-end
                                                                                                                                                                                                                               second through last token (colon optional)
                                                                                                                                                                                                                                                                                                                                                                               first token
                                                                                                                                                                                                                                                                                        first token (colon optional)
                                                                                                                                                                                                                                                             last token (colon optional)
                                                                                                                                                                                                                                                                                                                  (start+1) through (end+1) tokens
                                                                                                                                                                                                                                                                                                                                                (number+1)st token
```

Accessing portions of filenames

the filename can be extracted as follows: If the token extracted is a file name, the various parts of let filename be /usr/include/stdio.h

```
:h head /usr/include
:r root /usr/include/stdio
:e extension h
:t tail stdio.h
```

53 % ls /usr/include/stdio.h /usr/include/stdio.h 54 % echo !53:1:h /usr/include

History substitution: !event:s/sss/ttt/

Control Structures

- ı the C shell prompts with a ? for each subsequent line. If a control structure is entered on the keyboard on several lines,
- foreach...end

```
end
                                  foreach name (wordList)
                 command-list
                 # break/continue
                  can be used
                  as commands
```

example:

foreach color (red blue green)
 echo \$color
end

```
echo gotta jump
goto endOfScript
echo I will never echo this
endOfScript:
echo the end
                                                                                                                           - goto name
                                                                                           example:
```

if..then..else..endif

```
#!/bin/csh
onintr controlC
while (1)
    echo infinite loop
    sleep 2
end
controlC:
    echo control C detected
                                                                                                                          onintr label
```

                                                                                                                                                                                                 second to last referenced job
                                                                                                                                                                                                                                                                         jobs beginning with prefix
                                                                                                                                                                                                                           same as $+
                                                                                                                                                                                                                                               last referenced job
```

if no job specified, last referenced job is used suspends job % stop %job

% suspend suspends the shell that invokes the command; useful only when shell was invoked as a child process

sets the run level priority for the command (larger the number % nice integer command used by super user only) lower the priority; default = 4; negative numbers can be

- Terminating the login shell

C

% exit

% set ignoreeof

prevents ^D logout

.logout file is executed by login shell when it terminates

Some built-in commands:

% chdir # works same as cd

% glob # works same as echo except it NULL terminates its output useful in C programs.

% source file executes commands stored in file Directory Stack:

% pushd dir # same as cd except current dir is pushed on stack

% popd

read details

- Hash table of executables in \$PATH directories (to speed up)
- Whenever a new executable is added to a directory in \$PATH, use

% rehash

to reconstruct hash table.

% unhash disables hash table; slows search process
