Chapter 5 Outline

- More Complex SQL Retrieval Queries
- Specifying Constraints as Assertions and Actions as Triggers
- Views (Virtual Tables) in SQL
- Schema Change Statements in SQL

More Complex SQL Retrieval Queries

- Additional features allow users to specify more complex retrievals from database:
 - Nested queries, joined tables, outer joins, aggregate functions, and grouping

Addison-Wesley is an imprint of

Comparisons Involving NULL and Three-Valued Logic

- Meanings of NULL
 - Unknown value
 - Unavailable or withheld value
 - Not applicable attribute
- Each individual NULL value considered to be different from every other NULL value
- SQL uses a three-valued logic:
 - TRUE, FALSE, and UNKNOWN

Comparisons Involving NULL and Three-Valued Logic (cont'd.)

Table 5.1	Logical Connectives in	Three-Valued Logic		
(a)	AND	TRUE	FALSE	UNKNOWN
	TRUE	TRUE	FALSE	UNKNOWN
	FALSE	FALSE	FALSE	FALSE
	UNKNOWN	UNKNOWN	FALSE	UNKNOWN
(b)	OR	TRUE	FALSE	UNKNOWN
	TRUE	TRUE	TRUE	TRUE
	FALSE	TRUE	FALSE	UNKNOWN
	UNKNOWN	TRUE	UNKNOWN	UNKNOWN
(c)	NOT			
	TRUE	FALSE		
	FALSE	TRUE		
	UNKNOWN	UNKNOWN		

PEARSON

Comparisons Involving NULL and Three-Valued Logic (cont'd.)

- SQL allows queries that check whether an attribute value is NULL
 - IS **or** IS NOT NULL

Query 18. Retrieve the names of all employees who do not have supervisors.

Q18:	SELECT	Fname, Lname
	FROM	EMPLOYEE
	WHERE	Super_ssn IS NULL;

Nested Queries, Tuples, and Set/Multiset Comparisons

Nested queries

- Complete select-from-where blocks within WHERE clause of another query
- Outer query
- Comparison operator IN
 - Compares value v with a set (or multiset) of values V
 - Evaluates to TRUE if v is one of the elements in

Q4A:	SELECT FROM WHERE	DISTINCT Pnum PROJECT Pnumber IN (SELECT FROM WHERE OR Pnumber IN (SELECT	Pnumber PROJECT, DEPARTMENT, EMPLOYEE Dnum=Dnumber AND Mgr_ssn=Ssn AND Lname='Smith') Pno
		(SELECT FROM	Pno WORKS_ON, EMPLOYEE
		WHERE	Essn=Ssn AND Lname='Smith');

Use tuples of values in comparisons
 Place them within parentheses

SELECT	DISTINCT Essn		
FROM	WORKS_ON		
WHERE	(Pno, Hours) IN (S	ELECT	Pno, Hours
	F	ROM	WORKS_ON
	W	/HERE	Essn='123456789');

Use other comparison operators to compare a single value v

ANY (or = SOME) operator

- Returns TRUE if the value v is equal to some value in the set V and is hence equivalent to IN
- Other operators that can be combined with ANY (or SOME): >, >=, <, <=, and <>

SELECT	Lname, Fname		
FROM	EMPLOYEE		
WHERE	Salary > ALL	(SELECT	Salary
		FROM	EMPLOYEE
		WHERE	Dno=5);

- Avoid potential errors and ambiguities
 - Create tuple variables (aliases) for all tables referenced in SQL query

Query 16. Retrieve the name of each employee who has a dependent with the same first name and is the same sex as the employee.

Q16:	SELECT	E.Fname, E.Lname	
	FROM	EMPLOYEE AS E	
	WHERE	E.Ssn IN (SELECT	Essn
		FROM	DEPENDENT AS D
		WHERE	E.Fname=D.Dependent_name
			AND E.Sex=D.Sex);

Correlated Nested Queries

Correlated nested query

 Evaluated once for each tuple in the outer query

The EXISTS and UNIQUE Functions in SQL

- EXISTS function
 - Check whether the result of a correlated nested query is empty or not
- EXISTS and NOT EXISTS
 - Typically used in conjunction with a correlated nested query
- SQL function UNIQUE (Q)
 - Returns TRUE if there are no duplicate tuples in the result of query Q

Explicit Sets and Renaming of Attributes in SQL

- Can use explicit set of values in WHERE clause
- Use qualifier AS followed by desired new name
 - Rename any attribute that appears in the result of a query

Q8A:	SELECT	E.Lname AS Employee_name, S.Lname AS Supervisor_name
	FROM	EMPLOYEE AS E, EMPLOYEE AS S
	WHERE	E.Super_ssn=S.Ssn;

Joined Tables in SQL and Outer Joins

Joined table

- Permits users to specify a table resulting from a join operation in the FROM clause of a query
- The FROM clause in Q1A
 - Contains a single joined table
- O1A: SELECT Fname, Lname, Address FROM (EMPLOYEE JOIN DEPARTMENT ON Dno=Dnumber) WHERE Dname='Research';

Joined Tables in SQL and Outer Joins (cont'd.)

- Specify different types of join
 - NATURAL JOIN
 - Various types of OUTER JOIN

NATURAL JOIN on two relations R and S

- No join condition specified
- Implicit EQUIJOIN condition for each pair of attributes with same name from R and S

Copyright © 2011 Ramez Elmasri and Shamkant Navathe

Joined Tables in SQL and Outer Joins (cont'd.)

Inner join

- Default type of join in a joined table
- Tuple is included in the result only if a matching tuple exists in the other relation

LEFT OUTER JOIN

- Every tuple in left table must appear in result
- If no matching tuple
 - Padded with NULL values for attributes of right table

Copyright © 2011 Ramez Elmasri and Shamkant Navathe

Joined Tables in SQL and Outer Joins (cont'd.)

RIGHT OUTER JOIN

- Every tuple in right table must appear in result
- If no matching tuple
 - Padded with NULL values for the attributes of left table
- FULL OUTER JOIN
- Can nest join specifications

Aggregate Functions in SQL

Used to summarize information from multiple tuples into a single-tuple summary

Grouping

- Create subgroups of tuples before summarizing
- Built-in aggregate functions
 - COUNT, SUM, MAX, MIN, and AVG
- Functions can be used in the SELECT clause or in a HAVING clause

Copyright © 2011 Ramez Elmasri and Shamkant Navathe

Aggregate Functions in SQL (cont'd.)

 NULL values discarded when aggregate functions are applied to a particular column

Query 20. Find the sum of the salaries of all employees of the 'Research' department, as well as the maximum salary, the minimum salary, and the average salary in this department.

Q20:	SELECT	SUM (Salary), MAX (Salary), MIN (Salary), AVG (Salary)
	FROM	(EMPLOYEE JOIN DEPARTMENT ON Dno=Dnumber)
	WHERE	Dname='Research';

Queries 21 and 22. Retrieve the total number of employees in the company (Q21) and the number of employees in the 'Research' department (Q22).

Q21:	SELECT FROM	COUNT (*) EMPLOYEE;
Q22:	SELECT FROM WHERE	COUNT (*) EMPLOYEE, DEPARTMENT DNO=DNUMBER AND DNAME='Research';

Addison-Wesley is an imprint of

Grouping: The GROUP BY and HAVING Clauses

- Partition relation into subsets of tuples
 - Based on grouping attribute(s)
 - Apply function to each such group independently
- GROUP BY clause
 - Specifies grouping attributes
- If NULLs exist in grouping attribute
 - Separate group created for all tuples with a NULL value in grouping attribute

Copyright © 2011 Ramez Elmasri and Shamkant Navathe

Grouping: The GROUP BY and HAVING Clauses (cont'd.)

- HAVING clause
 - Provides a condition on the summary information

Query 28. For each department that has more than five employees, retrieve the department number and the number of its employees who are making more than \$40,000.

Q28:	SELECT	Dnumber, COUNT (*)	
	FROM	DEPARTMEN	T, EMPLOYEE
	WHERE	Dnumber=Dno	o AND Salary>40000 AND
		(SELECT	Dno
		FROM	EMPLOYEE
		GROUP BY	Dno
		HAVING	COUNT $(*) > 5)$

Discussion and Summary of SQL Queries

SELECT <attribute and function list> FROM [WHERE <condition>] [GROUP BY <grouping attribute(s)>] [HAVING <group condition>] [ORDER BY <attribute list>];

PEARSON

Specifying Constraints as Assertions and Actions as Triggers CREATE ASSERTION

 Specify additional types of constraints outside scope of built-in relational model constraints

CREATE TRIGGER

 Specify automatic actions that database system will perform when certain events and conditions occur

Specifying General Constraints as Assertions in SQL

CREATE ASSERTION

- Specify a query that selects any tuples that violate the desired condition
- Use only in cases where it is not possible to use CHECK on attributes and domains

```
CREATE ASSERTION SALARY_CONSTRAINT
CHECK ( NOT EXISTS ( SELECT *
FROM EMPLOYEE E, EMPLOYEE M,
DEPARTMENT D
WHERE E.Salary>M.Salary
AND E.Dno=D.Dnumber
AND D.Mgr_ssn=M.Ssn ) );
```

Introduction to Triggers in SQL

- CREATE TRIGGER statement
 - Used to monitor the database
- Typical trigger has three components:
 - Event(s)
 - Condition
 - Action

Views (Virtual Tables) in SQL

Concept of a view in SQL

- Single table derived from other tables
- Considered to be a virtual table

Specification of Views in SQL

CREATE VIEW command

 Give table name, list of attribute names, and a query to specify the contents of the view

V1:	CREATE VIEW	WORKS_ON1
	AS SELECT	Fname, Lname, Pname, Hours
	FROM	EMPLOYEE, PROJECT, WORKS_ON
	WHERE	Ssn=Essn AND Pno=Pnumber;
V2:	CREATE VIEW	DEPT_INFO(Dept_name, No_of_emps, Total_sal)
	AS SELECT	Dname, COUNT (*), SUM (Salary)
	FROM	DEPARTMENT, EMPLOYEE
	WHERE	Dnumber=Dno
	GROUP BY	Dname;

Specification of Views in SQL (cont'd.)

- Specify SQL queries on a view
- View always up-to-date
 - Responsibility of the DBMS and not the user
- DROP VIEW command
 - Dispose of a view

View Implementation, View Update, and Inline Views

- Complex problem of efficiently implementing a view for querying
- Query modification approach
 - Modify view query into a query on underlying base tables
 - Disadvantage: inefficient for views defined via complex queries that are time-consuming to execute

View Implementation

View materialization approach

- Physically create a temporary view table when the view is first queried
- Keep that table on the assumption that other queries on the view will follow
- Requires efficient strategy for automatically updating the view table when the base tables are updated

View Implementation (cont'd.)

Incremental update strategies

 DBMS determines what new tuples must be inserted, deleted, or modified in a materialized view table

View Update and Inline Views

- Update on a view defined on a single table without any aggregate functions
 - Can be mapped to an update on underlying base table
- View involving joins
 - Often not possible for DBMS to determine which of the updates is intended

View Update and Inline Views (cont'd.)

- Clause WITH CHECK OPTION
 - Must be added at the end of the view definition if a view is to be updated
- In-line view
 - Defined in the FROM clause of an SQL query

SQL

Schema evolution commands

- Can be done while the database is operational
- Does not require recompilation of the database schema

The DROP Command

- DROP command
 - Used to drop named schema elements, such as tables, domains, or constraint
- Drop behavior options:
 - CASCADE and RESTRICT
- Example:
 - DROP SCHEMA COMPANY CASCADE;

Copyright © 2011 Ramez Elmasri and Shamkant Navathe

The ALTER Command

Alter table actions include:

- Adding or dropping a column (attribute)
- Changing a column definition
- Adding or dropping table constraints

Example:

ALTER TABLE COMPANY.EMPLOYEE ADD COLUMN Job VARCHAR(12);

To drop a column

Choose either CASCADE or RESTRICT

Copyright © 2011 Ramez Elmasri and Shamkant Navathe

The ALTER Command (cont'd.)

- Change constraints specified on a table
 - Add or drop a named constraint

ALTER TABLE COMPANY.EMPLOYEE DROP CONSTRAINT EMPSUPERFK CASCADE;

Summary

- Complex SQL:
 - Nested queries, joined tables, outer joins, aggregate functions, grouping
- CREATE ASSERTION and CREATE TRIGGER
- Views
 - Virtual or derived tables
