A Simple Example

```
import java.sql.*;
import java.io.*;
class simple {
  public static void main (String args [])
      throws SQLException, IOException {

    try {
      Class.forName ("oracle.jdbc.driver.OracleDriver");
    } catch (ClassNotFoundException e) {
        System.out.println ("Could not load the driver");
      }

    String user, pass;
    Connection conn = DriverManager.getConnection
          ("jdbc:oracle:thin:@tinman.cs.gsu.edu:1521:tinman",
           "raj","raj123");

    Statement stmt = conn.createStatement ();

    ResultSet rset = stmt.executeQuery
           ("select eno,ename,zip,hdate from employees");
    while (rset.next ()) {
      System.out.println(rset.getString(1) + "  " +
                         rset.getString(2) + "  " +
                         rset.getString(3) + "  " +
                         rset.getString(4));
    }
    stmt.close();
    conn.close();
  }
```

Developing JDBC Applications

The basic steps involved in developing JDBC applications are:

1. Import the JDBC classes (`java.sql.*`).
2. Load the JDBC drivers.
3. Connect to the database.
4. Interact with the database using JDBC.
5. Disconnect from database.

Using the `Statement` object

```
void add_catalog(Connection conn)
  throws SQLException, IOException {

  Statement stmt = conn.createStatement();

  String cnum   = readEntry("Course Number: ");
  String ctitle = readEntry("Course Title : ");
  String query = "insert into catalog values (" +
          "'" + cnum + "','" + ctitle + "')";
  try {
    int nrows = stmt.executeUpdate(query);
  } catch (SQLException e) {
      System.out.println("Error Adding Catalog Entry");
      while (e != null) {
        System.out.println("Message:"+e.getMessage());
        e = e.getNextException();
      }
      return;
    }
  stmt.close();
  System.out.println("Added Catalog Entry");
}
```

```
void create_table(Connection conn)
  throws SQLException, IOException {
  String query =  "create table deleted_scores (" +
           "sid       varchar2(5) not null," +
           "term      varchar2(10) not null," +
           "lineno    number(4) not null," +
           "compname  varchar2(15) not null," +
           "points    number(4) check(points >= 0))";

  Statement stmt = conn.createStatement ();
  try {
    stmt.executeUpdate(query);
  } catch (SQLException e) {
      System.out.println("Could not create table");
      while (e != null) {
        System.out.println("Message:"+e.getMessage());
        e = e.getNextException();
      }
      return;
    }
  System.out.println("Table created");
  stmt.close();
}
```

```
void drop_student(Connection conn,
                  String term_in, String ls)
    throws SQLException, IOException {

  String id = readEntry("Student ID to drop: ");
  String query0 = "insert into deleted_scores " +
    "select * from scores where sid = '" + id +
    "' and term = '" + term_in + "' and lineno = " + ls;
  String query1 = "delete scores where sid = '" + id +
    "' and term = '" + term_in + "' and lineno = " + ls;
  String query2 = "delete enrolls where sid = '" + id +
    "' and term = '" + term_in + "' and lineno = " + ls;

  conn.setAutoCommit(false);
  Statement stmt = conn.createStatement ();
  int nrows;
  try {
    nrows = stmt.executeUpdate(query0);
    nrows = stmt.executeUpdate(query1);
    nrows = stmt.executeUpdate(query2);
  } catch (SQLException e) {
      System.out.println("Could not drop student");
      while (e != null) {
        System.out.println("Message: "+e.getMessage());
        e = e.getNextException();
      }
      conn.rollback();
      return;
    }
  System.out.println("Dropped student");
  conn.commit();
  conn.setAutoCommit(true);
  stmt.close();
}
```

Using the `PreparedStatement` object

```
void add_students(Connection conn)
    throws SQLException, IOException {

  String id, ln, fn, mi;
  PreparedStatement stmt = conn.prepareStatement(
    "insert into students values (?, ?, ?, ?)"  );
  do {
    id = readEntry("ID (0 to stop): ");
    if (id.equals("0"))
      break;
    ln = readEntry("Last  Name    : ");
    fn = readEntry("First Name    : ");
    mi = readEntry("Middle Initial: ");
    try {
      stmt.setString(1,id);
      stmt.setString(2,fn);
      stmt.setString(3,ln);
      stmt.setString(4,mi);
      stmt.executeUpdate();
    } catch (SQLException e) {
      System.out.println("Error adding student");
    }
  } while (true);
  stmt.close();
}
```

Using the `CallableStatement` object

```
import java.sql.*;
import java.io.*;
class call3 {
  public static void main (String args [])
      throws SQLException, IOException {
    try {
      Class.forName ("oracle.jdbc.driver.OracleDriver");
    } catch (ClassNotFoundException e) {
        System.out.println ("Could not load the driver");
      }
    String user, pass;
    user = readEntry("userid  : ");
    pass = readEntry("password: ");
    Connection conn = DriverManager.getConnection
      ("jdbc:oracle:oci7:"+user+"/"+pass);

    int enum = readNumber("Enter the employee number: ");
    int cnum = readNumber("Enter the customer number: ");
    int onum = readNumber("Enter the order    number: ");
    CallableStatement stmt = conn.prepareCall
      ("{call process_orders.add_order(?,?,?,?)}");
    stmt.setInt(1,onum);
    stmt.setInt(2,cnum);
    stmt.setInt(3,enum);
    stmt.setNull(4,Types.DATE);
    conn.setAutoCommit(false);
```

```
  try {
    stmt.executeUpdate();
  } catch (SQLException e) {
      System.out.println("Could not add order");
      conn.rollback();
      return;
    }
  stmt = conn.prepareCall
    ("{call process_orders.add_order_details(?,?,?)}");
  do {
    int pnum = readNumber(
        "Enter the part number (0 to stop): ");
    if (pnum == 0)
      break;
    int qty = readNumber("Enter the quantity   : ");
    stmt.setInt(1,onum);
    stmt.setInt(2,pnum);
    stmt.setInt(3,qty);
    try {
      stmt.executeUpdate();
    } catch (SQLException e) {
        System.out.println("Could not add odetail");
      }
  } while (true);
conn.commit();
conn.setAutoCommit(true);
stmt.close();
conn.close();
}
```

```
import java.sql.*;
import java.io.*;
class call1 {
  public static void main (String args [])
      throws SQLException, IOException {
    try {
      Class.forName ("oracle.jdbc.driver.OracleDriver");
    } catch (ClassNotFoundException e) {
        System.out.println ("Could not load the driver");
      }
    String user, pass;
    user = readEntry("userid  : ");
    pass = readEntry("password: ");
    Connection conn = DriverManager.getConnection
      ("jdbc:oracle:oci7:"+user+"/"+pass);

    String cnum = readEntry(
      "Enter the customer number to find city: ");
    CallableStatement stmt =
      conn.prepareCall ("{? = call get_city (?)}");
    stmt.setString(2,cnum);
    stmt.registerOutParameter(1,Types.VARCHAR);
    stmt.execute();
    String city = stmt.getString(1);
    if (stmt.wasNull())
      System.out.println("Customer's city = Null");
    else
      System.out.println("Customer's city = "+
                         stmt.getString(1));
    stmt.close();
    conn.close();
  }
}
```

Executing SQL Queries

```
void print_report(Connection conn,
                  String term_in, String ls)
      throws SQLException, IOException {

  String query0 = "select a, b, c, d from courses " +
    "where term = '" + term_in + "' and lineno = " + ls;

  String query1 = "select compname, maxpoints, weight " +
    "from components where term = '" + term_in +
    "' and lineno = " + ls;

  String query2 = "select E.sid, S.lname, S.fname " +
    "from enrolls E, students S " +
    "where S.sid = E.sid and " +
    "E.term = '" + term_in + "' and " +
    "E.lineno = " + ls + " order by lname, fname";

  String query3 = "select points " + "from scores " +
     "where term = '" +  term_in + "' and " +
     "lineno = '" + ls + "' and " +
     "sid = ? and " +    // substitute ? by sid
     "compname = ?";  // substitute ? by compname
```

```
double total;
