CHAPTER 4

Relational Database Management System: MySQL

This chapter introduces the student to the MySQL database management system and PHP, the programming language used to program applications that access a MySQL database. The discussion in this chapter is not specific to any version of MySQL and all examples would work with MySQL 4.0 or higher version.

The COMPANY database of the Elmasri/Navathe text is used throughout this chapter. In Section 4.1, a larger data set is introduced for the COMPANY database. In Section 4.2, the mysql utility is introduced which allows the users to interact with the database including running commands, executing SQL statements, and running MySQL scripts. In Section 4.3 PHP programming with MySQL is introduced through a complete Web browsing application for the COMPANY database. Finally, in Section 4.4 an online address book application is discussed with interfaces for adding, deleting, listing and searching a collection of contacts coded in HTML as well as in PHP.

4.1 COMPANY Database

Consider the COMPANY database state shown in Figure 5.6. Let us assume that the company is expanding with 3 new departments: Software, Hardware, and Sales. The Software department has 2 locations: Atlanta and Sacramento, the Hardware department is located in Milwaukee, and the Sales department has 5 locations: Chicago, Dallas, Philadelphia, Seattle, and Miami.

The Software department has 3 new projects: OperatingSystems, DatabaseSystems, and Middleware and the Hardware department has 2 new projects: InkjetPrinters and LaserPrinters. The company has added 32 new employees in this expansion process.

The updated COMPANY database is shown in the following tables.

<table>

4.2 mysql Utility

MySQL database system provides an interactive utility, called mysql, which allows the user to enter SQL commands interactively. One can also include one or more SQL statements in a file and have them executed within mysql using the source command.

In the following discussion, we will assume that your MySQL administrator has created a database called **company**, created a MySQL user called **book**, and has granted all rights to the **company** database to the **book** user.

The following mysql session creates the department table:

```
$ mysql -u book -p
Enter password:
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 1485 to server version: 4.1.9-standard
Type 'help;' or '\h' for help. Type '\c' to clear the buffer.

mysql> use company
Reading table information for completion of table and column names
You can turn off this feature to get a quicker startup with -A

Database changed
mysql> source create-department.sql;
Query OK, 0 rows affected (0.04 sec)

mysql> show tables;
+-------------------+
| Tables_in_company |
+-------------------+
| department        |
| foo               |
+-------------------+
2 rows in set (0.00 sec)

mysql> exit;
Bye
$`

---

4 The administrator command to create a MySQL user **is**: `create user book identified by 'book';` Here the user id is **book** and the password is also **book**.

5 The administrator command to create a database called **company** and to assign all rights to the **book** user **is**:

```
grant all on company.* to 'book'@'hostname.domain.edu';
```
In the above mysql session, the user invokes the mysql program with the userid book and the –p option to specify the password in a separate line. After connecting to the database server, the use command is executed to start using the company database. Then, the source command is executed on the file create-department.sql that contains the following SQL statement:

```sql
CREATE TABLE department (
    dname        varchar(25) not null,
    dnumber      integer(4),
    mgrssn       char(9) not null,
    mgrstartdate date,
    primary key (dnumber),
    key (dname)
);
```

Note: The data types supported in different DBMSs may have slightly different names; Please consult MySQL documentation to learn about all data types supported.

**Bulk Loading of Data**

MySQL provides a “load” command that can load data stored in a text file into a table. The following mysql session illustrates the loading of the data located in department.csv file into the department table. In the following example, the load command is directly entered at the mysql prompt. It may be a good idea to create a script file with the load command and use the source command to execute the load command. This way, if there are any syntax errors, these can be corrected in the script file and the load command can be re-executed.

```
$ mysql -u raj -p
Enter password:
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 1493 to server version: 4.1.9-standard

Type 'help;' or '\h' for help. Type '\c' to clear the buffer.

mysql> use company;
Reading table information for completion of table and column names
You can turn off this feature to get a quicker startup with -A

Database changed
mysql> LOAD DATA LOCAL INFILE "department.csv"
INTO TABLE department FIELDS TERMINATED BY ","
OPTIONALLY ENCLOSED BY "";
Query OK, 6 rows affected (0.00 sec)
Records: 6 Deleted: 0 Skipped: 0 Warnings: 0
```
The `LOAD DATA` command takes the name of the data file as parameter and other information such as field terminator symbols (in this case the comma) and loads the data into the table. For more details on the `load` command, please consult the MySQL documentation.

### 4.3 MySQL and PHP Programming

PHP is a very popular Web scripting language that allows the programmers to rapidly develop Web applications. In particular, PHP is most suited to develop Web applications that access a MySQL database. In this section, we illustrate the ease of programming with PHP and provide several examples of Web access to MySQL databases.

**Example 1**: Consider the problem of finding employee names given their social security number. To implement this problem as a Web application, we can design two Web pages:

1. The first Web page would contain a HTML form that contains a select list of social security numbers of employees and a submit button.

2. Upon choosing a social security number and submitting the form in the first Web page produces the second Web page that lists the name of the employee.

The two Web pages are shown in Figures 4.1 and 4.2.
Both these Web pages contain dynamic information (obtained from the database) and therefore can easily be produced by PHP scripts. The PHP script \texttt{p1post.php} that produces the first Web page is shown below.
A PHP script typically consists of HTML code to display “static” parts of the Web page interspersed with procedural PHP statements that produce “dynamic” parts of the Web page. The dynamic content may come from a database such as MySQL and hence most of the PHP procedural code involves connecting to the database, running queries and using the query result to produce parts of the Web page.

In the above example script, a simple HTML page is produced which has:

- Some static content such as text headers and a HTML form with a submit button. The HTML form when submitted invokes the second PHP script called “p1.php”.

```php
$database = "company";
@mysql_select_db($database) or die("Unable to select database");
$query = "SELECT ssn FROM employee";
$num = mysql_numrows($result);

while ($i < $num) {
    $ssn = mysql_result($result, $i, "ssn");
    echo "<option>\n", $ssn, "\n";
    $i++;
}
```
• A dynamic “select” GUI element within the HTML form which contains a list of employee social security numbers for the users to choose from.

PHP statements are enclosed within `<? And ?>`. HTML code can be produced within PHP code using the “echo” command as is seen in several places in the code. As can be seen, there are two blocks of PHP code in the example: one to connect to the database and execute a query and the second to use the results of the query to produce the HTML “select” list options.

The PHP script (`p1.php`) to produce the second Web page is shown next:

```html
<html>
<head>
<title>Simple Database Access</title>
</head>
<body>
<h4>Employee Information</h4>

<?
$username="user";
$password="password";
$database="company";
$ssn=$_POST['ssn'];
mysql_connect(localhost,$username,$password);
@mysql_select_db($database) or die( "Unable to select database");
$query="SELECT * FROM employee where ssn=$ssn";
$result=mysql_query($query);
$num=mysql_numrows($result);
mysql_close();
if ($num == 1) {
    $fname=mysql_result($result,$i,"fname");
    $minit=mysql_result($result,$i,"minit");
    $lname=mysql_result($result,$i,"lname");
    echo "<b>$fname $minit, $lname</b>";
}
?>
</body>
</html>
```

In this script, the employee social security number posted in the first Web page is retrieved using the PHP statement

```php
$ssn=$_POST['ssn'];
```

This social security number is then used in an SQL query to retrieve employee name. The script contains one block of PHP code surrounded by some HTML code.
Example 2: In this example, a PHP script that lists all employees in a given department is shown. The script takes as input the department number as a “GET” parameter in the URL itself as follows:

http://localhost/company/p2?dno=4

The Web page produced by the script is shown in Figure 4.3.

![Web Page for Example 2](image)

Figure 4.3: Web Page for Example 2

The PHP code (p2.php) is shown below:

```php
<?
$username="user";
$password="password";
$database="company";
$dno=$_GET['dno'];
mysql_connect(localhost,$username,$password);
@mysql_select_db($database) or die( "Unable to select database");
$query="SELECT lname,salary FROM employee where dno=$dno";
$result=mysql_query($query);
```
$num=mysql_numrows($result);
mysql_close();
?>

<table border="2" cellspacing="2" cellpadding="2">
<tr><th><font face="Arial,Helvetica,sans-serif">Last Name</font></th>
<th><font face="Arial,Helvetica,sans-serif">Salary</font></th></tr>

<?
echo "<h4>Employees in Department $dno</h4>";
$i=0;
while ($i < $num) {
   $lname=mysql_result($result,$i,"lname");
   $salary=mysql_result($result,$i,"salary");
   ?>
<tr><td><font face="Arial, Helvetica, sans-serif"><? echo $lname; ?></font></td>
<td><font face="Arial, Helvetica, sans-serif"><? echo $salary; ?></font></td></tr>
<?
   $i++;
}
?>
</table>
</body>
</html>

The PHP script performs an SQL query to retrieve employee names and salaries who work for the given department. This information is then formatted neatly into an HTML table for display. This example illustrates more intricate embedding of PHP code within HTML code as is seen in the “while” loop towards the end of the script.

Example 3: A COMPANY database browser application is shown in this example. The initial Web page in this application lists all the departments in the company. By following hyperlinks, the user may see more details of departments, employees, and projects in three separate Web pages. The browser program is implemented using four PHP scripts:

(a) companyBrowse.php: This script lists all the departments in the company in a tabular form as shown in Figure
The code for companyBrowse script is shown below:

```php
<html>
<head>
<title>All Departments</title>
</head>
<body>

<?
$username="user";
$password="password";
$database="company";

mysql_connect("host.domain.edu", $username, $password);
@mysql_select_db($database) or die( "Unable to select database");
$query="SELECT dnumber, dname FROM department order by dnumber";
$result=mysql_query($query);
$num=mysql_numrows($result);
mysql_close();
?>

<h4>Departments of Company</h4>
<table border="2" cellspacing="2" cellpadding="2">
<tr>
<th><font face="Arial, Helvetica, sans-serif">Department Number</font></th>
<th><font face="Arial, Helvetica, sans-serif">Department Name</font></th>
</tr>

<?
$i=0;
while ($i < $num) {
    $dno=mysql_result($result,$i,"dnumber");
    $dname=mysql_result($result,$i,"dname");
    ?>
    <tr>
    <td><font face="Arial, Helvetica, sans-serif"><a href="deptView?dno=<? echo $dno; ?>"><? echo $dno; ?></a></font></td>
    <td><font face="Arial, Helvetica, sans-serif"><? echo $dname; ?></font></td>
    </tr>
<?
```
The script performs a simple query on the DEPARTMENT table and outputs the list of department numbers and names formatted as an HTML table as shown in Figure 4.4.

![All Departments Web Page – COMPANY database browser](image)

**Figure 4.4: All Departments Web Page – COMPANY database browser**

The department numbers in this list are formatted as HTML hyperlinks that, when traversed by the user, will produce a Web page containing more details of the chosen department. The detailed department view Web page is shown in Figure 4.5.
The PHP script (`deptView.php`) that produces the detailed department view is shown below.

```php
<html>
<head>
<title>Department View</title>
</head>
<body>

<?
$username="user";
$password="password";
$database="company";
```
$_GET['dno'];
mysql_connect("host.domain.edu",$username,$password);
@mysql_select_db($database) or die( "Unable to select database");

$query="SELECT dname,mgrssn,mgrstartdate,lname,fname FROM department,employee where dnumber=$dno and mgrssn=ssn";
$result=mysql_query($query);
$num=mysql_numrows($result);

$dname=mysql_result($result,0,"dname");
$mssn=mysql_result($result,0,"mgrssn");
$mstart=mysql_result($result,0,"mgrstartdate");
$mlname=mysql_result($result,0,"lname");
$mfname=mysql_result($result,0,"fname");

echo "<b>Department: </b>" ,$dname;
echo "<P>Manager: <a href="empView?", $mssn, ","></a></BR>";,
echo "Manager Start Date: ", $mstart;

echo "<h4>Department Locations:</h4>";
$query="SELECT dlocation FROM dept_locations where dnumber=$dno";
$result=mysql_query($query);
$num=mysql_numrows($result);
$i=0;
while ($i < $num) {
    $dloc=mysql_result($result,$i,"dlocation");
    echo $dloc, "<BR>
";
    $i++;
}

echo "<h4>Employees:</h4>";
$query="SELECT ssn,lname,fname FROM employee where dno=$dno";
$result=mysql_query($query);
$num=mysql_numrows($result);
?

<table border="2" cellspacing="2" cellpadding="2">
<tr>
    <th><font face="Arial, Helvetica, sans-serif">
        Employee SSN</font></th>
    <th><font face="Arial, Helvetica, sans-serif">
        Last Name</font></th>
    <th><font face="Arial, Helvetica, sans-serif">
        First Name</font></th>
</tr>
<? 
$i=0;
while ($i < $num) {
    $essn=mysql_result($result,$i,"ssn");
    $elname=mysql_result($result,$i,"lname");
    $efname=mysql_result($result,$i,"fname");
?>
<tr>
    <td><font face="Arial, Helvetica, sans-serif">
<a href="empView?ssn=<? echo $essn; ?>"><? echo $essn; ?></a></font></td>
    <td><font face="Arial, Helvetica, sans-serif"><? echo $elname; ?></font></td>
    <td><font face="Arial, Helvetica, sans-serif"><? echo $efname; ?></font></td>
</tr>
<i>$i++;</i>
<?
</table>

<? 
echo "<h4>Projects:</h4>";
$query="SELECT pnumber,pname,plocation FROM project where dnum=$dno";
$result=mysql_query($query);
$num=mysql_numrows($result);
?>
<table border="2" cellspacing="2" cellpadding="2">
<tr>
    <th><font face="Arial, Helvetica, sans-serif">Project Number</font></th>
    <th><font face="Arial, Helvetica, sans-serif">Project Name</font></th>
    <th><font face="Arial, Helvetica, sans-serif">Location</font></th>
</tr>
<i>$i=0;</i>
while ($i < $num) {
    $pnum=mysql_result($result,$i,"pnumber");
    $pname=mysql_result($result,$i,"pname");
    $ploc=mysql_result($result,$i,"plocation");
?>
The `deptView` script executes the following four queries and formats the results of the queries as shown in the Web page.

```
SELECT dname,mgrssn,mgrstartdate,lname,fname
FROM   department,employee
WHERE  dnumber=$dno and mgrssn=ssn

SELECT dlocation
FROM   dept_locations
WHERE  dnumber=$dno

SELECT ssn,lname,fname
FROM   employee
WHERE  dno=$dno

SELECT pnumber,pname,plocation
FROM   project
WHERE  dnum=$dno
```

Each of these queries uses the PHP variable `$dno` containing the department number for which the view is generated.

The department view also contains hyperlinks for employees and projects which when traversed by the user produces detailed employee and project Web pages. The code for PHP scripts that produce these Web pages is omitted as they are similar to the `deptView` script.
4.4 Online Address Book

In this section an online address/contact book application is illustrated. The application is coded in PHP and accesses a MySQL database which has the following table:

```sql
create table contacts (
  lname  varchar(30),
  fname  varchar(30),
  email  varchar(30),
  homePhone varchar(20),
  cellPhone varchar(20),
  officePhone varchar(20),
  address varchar(100),
  comment varchar(100),
  primary key (lname,fname)
);
```

The application is capable of the following functions:

1. ADD a new contact.
2. DELETE one or more contacts.
3. SEARCH contacts by substring match on name.
4. LIST all contacts.

The initial Web page is shown in Figure 4.6. On the left frame, the menu options are listed and the right frame contains space to display results.

![Figure 4.6: Address Book – Main Page](image-url)
The HTML code that produces this (index.html) page is shown below:

```html
<html>
<head>
<title>Addressbook</title>
</head>
<frameset rows="*" cols="18%,*" framespacing="0"
    frameborder="no" border="0">
  <frame src="mainMenu.html" name="leftFrame" scrolling="No"
    noresize="noresize" id="leftFrame" />
  <frame src="Welcome.html" name="mainFrame" id="mainFrame" />
</frameset>
</html>
```

The HTML code that produces the left frame (mainMenu.html) is shown below:

```html
<html>
<head>
<title>Addressbook</title>
</head>
<body>
  <p>
    &nbsp;&nbsp;&nbsp;Address Book
  </p>
  <h3><a href="add.html" target="mainFrame">Add</a></h3>
  <h3><a href="delete.php" target="mainFrame">Delete</a></h3>
  <h3><a href="search.html" target="mainFrame">Search</a>
  </h3>
  <h3><a href="list.php" target="mainFrame">List All</a>
  </h3>
</body>
</html>
```

The HTML code (Welcome.html) to produce the right frame is shown below:

```html
<html>
<head><title>Addressbook</title></head>
<body>
  <BR><BR><BR><BR><BR><BR><BR>
  <center>
    <h2>Welcome to the Addressbook App</h2>
  </center>
</body>
</html>
```

Add

Upon clicking the “Add” menu option, the form shown in Figure 4.7 is displayed on the right frame:
Mandatory fields are marked with an “*”. The HTML code (add.html) that produces this Web page is shown below:

```
<html>
<head>
<title>Add</title>
</head>
<body>
<h2>Add Contact Information</h2>
<form name="addform" action="add.php" method="post">
<table width="60%" border="0" cellpadding="3" cellspacing="12">
<tr>
<td width="130"><strong>First Name:</strong> *</td>
<td><input name="fname" type="text" size="30" maxlength="30" /></td>
</tr>
<tr>
<td width="130"><strong>Last Name:</strong> *</td>
<td><input name="lname" type="text" size="30" maxlength="30" /></td>
</tr>
</table>
</form>
</body>
</html>
```
The code to process the submission of the “ADD” form (add.php) is shown below:

```php
<?php
// connect to my sql
$host="localhost"; // Host name
$username="id";        // Mysql username
$password="pwd";     // Mysql password
$db_name="db";        // Database name
$tbl_name="contacts"; // Table name

// Connect to server and select database.
mysql_connect("$host", "$username", "$password")or die("cannot connect");
mysql_select_db("$db_name")or die("cannot select DB");

// retrieve all variables
$fname = @$_POST["fname"];  
```
$lname = @$_POST["lname"];
$email = @$_POST["email"];  
$homePhone = @$_POST["homePhone"];  
$cellPhone = @$_POST["cellPhone"];  
$officePhone = @$_POST["officePhone"];  
$address = @$_POST["address"];  
$comment = @$_POST["comment"];

// insert information to database
$sql="insert into $tbl_name values 
    ("$lname","$fname","$email","$homePhone","$cellPhone", 
    "$officePhone","$address","$comment");"
$result = mysql_query($sql);
mysql_close();  
?>

<html>
<head>
<title>Add processed</title>
<body>
<p>&nbsp;</p>
<p>&nbsp;</p>
<p>&nbsp;</p>
<blockquote>
<p>
<h3>Your information is added to database. </h3>
<body>
<p>&nbsp;</p>
<p>&nbsp;</p>
<p>&nbsp;</p>
</blockquote>
</body>
</html>

The program first connects to the database, then retrieves all submitted data into variables and then constructs an SQL insert statement. Finally, it executes the insert statement and prints a message.

List All

Upon clicking the “List ALL” option, the Web page shown in Figure 4.8 is shown on the right frame. This is an alphabetical listing of all contacts, each hyper-linked to go to a detail page.
The code to display the list is shown below:

```php
<?php
// connect to my sql
$host="localhost"; // Host name
$username="id";  // Mysql username
$password="pwd";  // Mysql password
$db_name="db";  // Database name
.tbl_name="contacts"; // Table name

// Connect to server and select database.
mysql_connect("$host", "$username", "$password") or die("cannot connect");
mysql_select_db("$db_name") or die("cannot select DB");

// show all contact information
$sql="select * from $tbl_name order by lname";
$result = mysql_query($sql);
mysql_close();
?>

<html>
<head>
<title>List</title>
</head>
<body>
<p>&nbsp;</p>
<p>&nbsp;</p>
<p>&nbsp;</p>
<blockquote>
<h2>All Contact Information</h2>
</blockquote>
</p>
<h2>All Contact Information</h2>
```
<?php
    if (mysql_num_rows($result)==0) {
        echo "<h4>No data<h4>";
    } else {
        while($row = mysql_fetch_assoc($result)) {
            $lname = $row['lname'];
            $fname = $row['fname'];
            echo "<ul><li><h4><a href="detail.php? lname=$lname&fname=$fname">$lname, $fname</a><h4></li></ul>";
        }
    }
?></blockquote>
</body>
</html>

The program connects to the database and executes a simple query and displays the results on the Web page. Each contact is hyper-linked to the detail.php program.

Detail

Upon clicking the link, the detail page shown in Figure 4.9 is shown.

![Address Book](image)

**Figure 4.9: Address Book – Detail**
The code that produces the detail page is shown below:

```php
<?php
// connect to my sql
$host="tinman.cs.gsu.edu"; // Host name
$username="cms";        // Mysql username
$password="cms123";     // Mysql password
$db_name="conf";        // Database name
.tbl_name="contacts"; // Table name

// Connect to server and select database.
mysql_connect($host, $username, $password)or die("cannot connect");
mysql_select_db($db_name)or die("cannot select DB");

// retrieve all variables
$fname = @$_GET["fname"];  
$lname = @$_GET["lname"];  

// show all contact information
$sql="select * from $tbl_name where fname='$fname' and lname='$lname'";
$result = mysql_query($sql);
$row = mysql_fetch_assoc($result);
mysql_close();
?>

<html>
<head>
<title>Detail</title>
</head>
<body>
<p>&nbsp;</p>
<p>&nbsp;</p>
<p>&nbsp;</p>
<blockquote>
<table width="60%" border="0" cellspacing="15">
    <tr>
        <td colspan="2"><p><h2><?php echo "$lname, $fname"; ?></h2></td>
    </tr>
    <tr>
        <td width="130">First Name :</td>
        <td><?php echo $row['fname']; ?></td>
    </tr>
    <tr>
        <td width="130">Last Name :</td>
        <td><?php echo $row['lname']; ?></td>
    </tr>
    <tr>
        <td width="130">E-mail Address :<br />
          </td>
        <td><?php echo $row['email']; ?></td>
    </tr>
    <tr>
        <td width="130">Home Phone :<br />
          </td>
        <td><?php echo $row['homePhone'] ?></td>
    </tr>
</table>
</blockquote>
</body>
</html>
```
The above code connects to the database and performs a query to get details of the requested contact. It then displays the data for the contact in a tabular format.

Delete

The delete contact interface is shown in Figure 4.10. The list of contacts is presented to the user along with a check box to the left of each contact. The user may choose one or more contacts and submit for deletion.

Figure 4.10: Address Book – Delete
The code to display the delete interface as well as to process the delete request (delete.php) is shown below:

```php
<?php

// connect to my sql
$host="localhost"; // Host name
$username="id"; // Mysql username
$password="pwd"; // Mysql password
$db_name="db"; // Database name
$tbl_name="contacts"; // Table name

// Connect to server and select database.
mysql_connect($host, $username, $password) or die("cannot connect");
mysql_select_db($db_name) or die("cannot select DB");

// delete record
$delete = 0;$_POST["delete"]; if ($delete == "Delete") {
    $dfname = @$_POST["dfname"];
    $dlname = @$_POST["dlname"];
    $checkbox = @$_POST["checkbox"]; // delete record
    foreach ($checkbox as $index){
        $sql = "delete from $tbl_name where fname='$dfname[$index]' ".
            "and lname='$dlname[$index]'";
        $result = mysql_query($sql);
    }
}

// show all contact information
$sql="select * from $tbl_name order by lname";
$result = mysql_query($sql);
mysql_close();
?>

<html
<head>
<title>Delete</title>
</head>
<body>
<p>&nbsp;</p>
<p>&nbsp;</p>
<p>&nbsp;</p>
<blockquote>
<h2>Delete Contact Information</h2>
<form name="myform" method="post" action="delete.php">
<table width="40%" border="0">
    <?php
    $index=0;
    while($row = mysql_fetch_assoc($result)) {
        $lname = $row['lname'];
        $fname = $row['fname'];
        echo "<tr><td width="25" valign="top">".
            "<input type="checkbox" name="checkbox[]" value="$index" />";
        echo "</td><td valign="bottom"><h4><a href="detail.php?".```
In the first part of the code, the database connection is established and if the delete submission is detected, the corresponding record is deleted from the database. Then, the listing of all contacts is produced along with the check boxes within an HTML form.

Search

The search interface is shown in Figure 4.11.
The search interface consists of a keyword text box along with options for choosing first name, last name or both for the search. The code (search.html) to produce the interface is shown below:

```html
<html>
<head>
<title>Search HTML</title>
</head>
<body>
<p>&nbsp;</p>
<p>&nbsp;</p>
<p>&nbsp;</p>
<blockquote>
<p>
<h2>Search Contact Information</h2>
<form action="result.php" method=post>
<table width="60%" border="0" cellpadding="5" cellspacing="20">
<tr>
<td width="115"><strong>Key Word :  </strong></td>
<td><input name="keyword" type="text" size="50" maxlength="50" /></td>
</tr>
<tr>
<td width="115">Seach in  </td>
<td><input name="searchin" type="radio" value="fname" checked/> &nbsp;First Name </td>
</tr>
<tr>
<td width="115">&nbsp;</td>
<td><input name="searchin" type="radio" value="lname" /> &nbsp;Last Name </td>
</tr>
<tr>
<td width="115">&nbsp;</td>
<td><input name="searchin" type="radio" value="both" /> &nbsp;First Name and Last Name </td>
</tr>
<tr>
<td>&nbsp;</td>
<td><input type="reset" name="Reset" value="Clear" /> &nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&n...
// Connect to server and select database.
$username="id";  // Mysql username
$password="pwd";  // Mysql password
$db_name="db";  // Database name
.tbl_name="contacts"; // Table name

mysql_connect("$host", "$username", "$password")or die("cannot connect");

    }
}?>
The above code connects to the database and executes a query to retrieve all contacts. Then, for each contact the appropriate filter is applied and only those contacts that pass the filter test are displayed in the Web page.

**Exercises**

NOTE: All references to Exercises and Laboratory Exercises in the following problems refer to the numbering in the Elmasri/Navathe text.

1. Consider the ER-schema generated for the CONFERENCE_REVIEW database in Laboratory Exercise 7.34 for which the relational database was created in Laboratory Exercise 9.13.
   a. Create the database tables in MySQL.
   b. Create comma separated data files containing data for at least 10 papers, 15 authors, and 8 reviewers. You must assign authors to papers, assign a contact author, and assign reviewers to papers. It is possible for some authors to be reviewers. In such a case, the reviewer should not be assigned to a paper in which he or she is an author. You should also create data for the individual reviews for each paper. The values for various rankings must be between 1 and 10.
   c. Using the MySQL loader command, load the data created in (b) into the database.
   d. Write SQL queries for the following and execute then in a MySQL interactive session.
      i. Retrieve the email and names of authors who have submitted more than one paper for review.
      ii. Retrieve the email id of the contact author, the title of paper submitted by that author, and the average rating received on its reviews such that the average rating was above 8.0.
      iii. Retrieve the paper id, title, and average ratings received for all papers sorted in decreasing order of average rating. Do not show any papers below an average rating of 3.0.
      iv. Retrieve the email and names of reviewers along with the average ratings they gave to papers assigned to them. Sort the result in increasing order of average rating.
      v. Retrieve the paper id and title of papers along with the author name and email id such that the author is also a reviewer.

2. Consider the SQL schema generated for the GRADE_BOOK database in Laboratory Exercise 8.28 for which the relational database was created in Laboratory Exercise 9.13.
a. Create the database tables in MySQL.

b. Create comma separated data files containing data for at least 20 students and 3 courses with an average of 8 students in each course. Create data for 3 to 4 grading components for each course. Then, create data to assign points to each student in every course they are enrolled in for each of the grading components.

c. Using the MySQL loader command, load the data created in (b) into the database.

d. Write SQL queries for the following and execute them in a MySQL interactive session.

   i. Retrieve the course numbers, titles, and term of courses in which student with id=1234 has enrolled.

   ii. Retrieve the term, section number, and course numbers along with their total enrollments.

   iii. Retrieve the term, section number, and course numbers of courses in which there is a grading component that has a weight of more than 50 and has fewer than 10 students.

   iv. Retrieve the names of students who have enrolled in all courses taught by the instructor in the Fall 2005 term.

3. Consider the SQL schema generated for the ONLINE_AUCTION database in Laboratory Exercise 8.29 for which the relational database was created and populated in Laboratory Exercise 9.14.

   a. Create the database tables in MySQL.

   b. Create comma separated data files containing data for at least 20 items with at least 10 buyers and at least 10 sellers. Observe the queries below and make sure that your data will be appropriate for those queries.

   c. Using the MySQL loader command, load the data created in (b) into the database.

   d. Write SQL queries for the following and execute them in a MySQL interactive session.

      i. Retrieve item numbers and descriptions of items that are still active (i.e. bidding has not closed) along with their current bidding price.

      ii. Retrieve the item numbers and descriptions of all items in which the member with member id abc24 is the winner.

      iii. Retrieve the member ids and names of members who have an average rating of 8.0 or above.

      iv. Retrieve the bidding history for the item with item number 1246. The bidding history should contain a chronological listing of all bids till the current time including the member id of the bidder and the bidding price.

      v. Retrieve the item number and titles of items that fall under the /COMPUTER/HARDWARE/PRINTER category and have “HP” in their titles and on which bidding has not yet closed sorted by time of bid closing.

4. Consider the CONFERENCE_REVIEW database of Laboratory Exercise 7.34 for which the relational database was created and populated in Laboratory Exercise 9.12. There are three types of users of the system: contact author, reviewer, and administrator. The contact author should be able to sign in and submit a paper to the conference; the reviewer should be able to submit reviews of papers assigned to him or her; and the administrator should be
able to assign reviewers to papers (at least three reviewers to each paper) as well as print a report of all papers sorted by average rating assigned by reviewers. The reviewers and administrator have pre-assigned user ids and passwords, however, contact authors must register themselves first before they can start using the system. Write a PhP-based application that implements the following functions:

a. A user registration page that allows a contact author to register their email and other information with the system. They choose a password in the registration page.

b. A user login page with GUI textbox elements to accept user id and password and radio buttons to choose between contact author, reviewer, and administrator. A separate menu for each user should be displayed after authentication.

c. The contact author should be able to enter details of his paper submission and upload a file.

d. The reviewer should be able to choose one of his assigned papers and submit a review for the paper.

e. The administrator should be able to assign at least three reviewers to each paper. The administrator should also be able to display a report of all papers sorted by average rating (high to low).

5. Consider the **GRADE_BOOK** database of Laboratory Exercise 8.28 for which the relational database was created and populated in Laboratory Exercise 9.13. Write and test PhP scripts that access the MySQL database that implements the following two functions for a given course section (the course number, term, and section information will be provided as GET parameters in the URL itself):

i. Allows the instructor to enter the points/scores for a particular grading component. The instructor should be able to choose a grading component using a pull down list.

ii. Allows the instructor to view the scores for all components for all students in a tabular form with one row per student and one column per grading component.

6. Consider the **ONLINE_AUCTION** database of Laboratory Exercise 8.29 for which the relational database was created and populated in Laboratory Exercise 9.14 in MySQL. Write PhP scripts to implement an online auction Web site. A member may register himself/herself and choose his/her password. After that, they may sign into the system. The following functions should be implemented:

a. A buyer should be able to search items by entering a keyword. The result of the search should be a listing of items, each with a hyper-link. Upon clicking on the hyper-link, a detailed page describing the item should be displayed. On this page, the user may place a bid on the item.

b. A seller should be able to place an item for sale by providing all details of the item along with auction deadlines etc.

c. Buyers and sellers should be able to look at a list of all items on which bidding has ended.

d. Buyers and sellers should be able to place a rating as well as view ratings on transactions they are involved in.
