CHAPTER 6

Projects

This chapter presents several projects to be completed by the student using Java/JDBC and Oracle database or using PHP and MySQL database. These projects may be assigned as group projects with teams of two or three students. A written documentation as well as a class presentation of the project may be required.

6.1 STUDENT REGISTRATION System (GoLunar)

Consider the following relational database and sample data for the student registration database (written in Oracle SQL):

```sql
drop table students cascade constraints;
create table students (  
    sid number(4) primary key,  
    password number(5),  
    fname varchar2(20),  
    lname varchar2(20),  
    sType varchar2(20) check (sType in ('GRAD','UGRAD')),  
    major char(4) check (major in ('CSC','MATH','POLS','HIST')),  
    gradAssistant char(1) check (gradAssistant in ('Y','N')),  
    inState char(1) check (inState in ('Y','N'))
);
insert into students values  
    (1111,1111,'John','Davison','UGRAD','CSC','N','Y');
insert into students values  
    (2222,2222,'Jacob','Oram','UGRAD','CSC','N','N');
insert into students values  
    (3333,3333,'Ashish','Bagai','GRAD','CSC','Y','N');
insert into students values  
    (4444,4444,'Joe','Harris','GRAD','CSC','N','Y');
insert into students values  
    (5555,5555,'Andy','Blignaut','GRAD','CSC','N','Y');
insert into students values  
    (6666,6666,'Pommie','Mbantwa','GRAD','CSC','N','Y');
insert into students values  
    (7777,7777,'Ian','Healy','GRAD','CSC','N','Y');
insert into students values  
    (8888,8888,'Dougie','Marillier','GRAD','CSC','N','Y');
--
drop table staff cascade constraints;
create table staff (  
    tid number(4) primary key,  
    password number(5),  
    fname varchar2(20),  
    lname varchar2(20),  
    staffType varchar2(10) check (staffType in ('REGISTRAR','DEPARTMENT'))
);  
```

insert into staff values
(1000,2000,'Venette','Rice','DEPARTMENT');
insert into staff values
(2000,2000,'Alison','Payne','REGISTRAR');
--
create or replace view lunarUsers as
(select sid uid, password, 'STUDENT' uType
from students) union
(select tid uid, password, staffType uType
from staff);
--
drop table courses cascade constraints;
create table courses (cprefix char(4), cno number(4), ctitle varchar2(50), chours number(2), primary key (cprefix,cno));
insert into courses values ('CSC',1010,'Computers and Applications',3);
insert into courses values ('CSC',2010,'Introduction to Computer Science',3);
insert into courses values ('CSC',2310,'Intro to Programming in Java',3);
insert into courses values ('CSC',2311,'Introduction to Programming in C++',3);
insert into courses values ('CSC',3410,'Data Structures',3);
insert into courses values ('CSC',3210,'Computer Organization',3);
insert into courses values ('CSC',3320,'Systems Programming in Unix and C',3);
insert into courses values ('MATH',2211,'Calculus I',5);
insert into courses values ('MATH',2212,'Calculus II',5);
insert into courses values ('MATH',2420,'Discrete Mathematics',3);
insert into courses values ('CSC',6220,'Networks',4);
insert into courses values ('CSC',8220,'Advanced Networks',4);
insert into courses values ('CSC',6710,'Database',4);
insert into courses values ('CSC',8710,'Advanced Database',4);
insert into courses values ('CSC',6820,'Graphics',4);
insert into courses values ('CSC',8820,'Advanced Graphics',4);
insert into courses values ('POLS',1200,'Intro Political Sci',3);
--
drop table sections cascade constraints;
create table sections (term char(2) check (term in ('FA','SP','SU')), year number(4), crn number(5), cprefix char(4), cno number(4), section number(2), days char(6), startTime char(5), endTime char(5), room varchar2(10), cap number(3), instructor varchar2(30), auth char(1) check (auth in ('Y','N')), primary key (term,year,crn), foreign key (cprefix,cno) references courses);
insert into sections values
('SU',2002,10101,'CSC',1010,1,'MWF','09.00','09.50','105G',35,'Bhola','N');
insert into sections values
('SU',2002,10701,'POLS',1200,1,'TR','09.00','09.50','205Sp',25,'Jones','N');
--
insert into sections values

--insert into sections values
--('SP',2003,10301,'CSC',2211,1,'TR','11.00','12.50','305G',35,'Li','N');
--insert into sections values
--('SP',2003,10302,'CSC',2211,2,'MWF','09.00','10.50','106GB',35,'Davis','N');
--drop table enrolls cascade constraints;
create table enrolls (  
sid number(4),
term char(2) check (term in ('FA','SP','SU')),  
year number(4),  
crn number(5),  
grade char(2) check (grade in ('A','B','C','D','F','I','IP','S','U')),  
primary key (sid,term,year,crn),
The database consists of the following tables:

1. Students: This table records information about students. The gradAssistant attribute records whether the student is a graduate assistant or not. The graduate assistants
automatically qualify for a full tuition waiver (they still have to pay the fixed fee). The `instate` attribute records whether the student is an in-state student or not. Again, this has an impact on the fees the student would pay.

2. **Staff**: This table records information about staff users of the system. There are two categories of staff: “Registrar” and “Department”. These users would have different capabilities and functions in the application to be developed.

   **Note**: A view called `lunarUsers` is created to provide a simple way to authenticate users of the system.

3. **Courses**: This table records information about courses in the university catalog which includes course number, title and credit hours. The credit hours value will be used in calculating the GPA in the student’s transcript.

4. **Sections**: This table records the course offerings for each term and includes the term, year, and course record number (`crn`), a unique number assigned to course offerings for a specific term and year. The table also includes start time and end time and meeting days as well as the name of the instructor. Finally, this table records a boolean value (yes or no) called `auth` to indicate if the registration for this course is open to all or is done only by authorization.

5. **Enrolls**: This table records information about which student has registered for which course offering.

6. **Authorizations**: This table records authorizations given to students for specific course offerings. Two types of authorizations are given: `OVFL` for overflow, i.e. allows students to register in a course offering that does not have any open seats, and `AUTH` for authorization to register in a course offering that is designated as a authorization only course offering.

7. **FixedFee**: This table records information about all fixed fees a student is required to pay each term they register.

8. **VariableFeeRate**: This table records per credit hour fee rate for different categories of students (graduate vs undergraduate students and in-state vs out-of-state students).

You will implement a University Registration System in Java using JDBC.

There are 3 kinds of database users:

1. **Registrar Staff**: These users will have the ability to load the database tables, make changes to courses, sections, fee details etc.

2. **Department Staff**: These users will have the ability to authorize students into sections, overflow students into sections, add assistantship information to the system, generate class lists etc.

3. **Student**: These users will be able to register for classes, see their schedules, see fee detail, see transcripts etc.
The following real-world constraints need to be enforced by your Java program:

1. Undergraduate students are not allowed to register for graduate courses numbered 6000 and above.
2. Students should not be allowed to register for a class which is FULL unless they have an overflow.
3. Students should not be allowed to register for a class which is listed as AUTHORIZATION ONLY unless they have an authorization.
4. Undergraduate students are not allowed to register for more than 20 hours in a semester and the limit for graduate students is 15.
5. Students cannot register for two classes that overlap in meeting time.

The Java application will be a terminal-based program that has the following interactions with the users. Based on the username, the program should determine the type of user and provide the appropriate menu.

**Department Staff Menu:**

```
$ java GoLunar OracleId
Oracle Password:xxxxxx
Semester (e.g. FA2003,SP2003,SU2003): SP2003
Username: 1000
Password:

6.2 Online Book Store Database System

Consider the following relational database schema written in Oracle SQL for an online book store application:

```sql
drop table books cascade constraints;
create table books (  
isbn char(10),
author varchar2(100) not null,
title varchar2(128) not null,
price number(7,2) not null,
subject varchar2(30) not null,
primary key (isbn)
);
```
drop table members cascade constraints;
create table members (  
    fname varchar2(20) not null,  
    lname varchar2(20) not null,  
    address varchar2(50) not null,  
    city varchar2(30) not null,  
    state varchar2(20) not null,  
    zip number(5) not null,  
    phone varchar2(12),  
    email varchar2(40),  
    userid varchar2(20),  
    password varchar2(20),  
    creditcardtype varchar2(10)  
    check(creditcardtype in ('amex','discover','mc','visa')),  
    creditcardnumber char(16),  
    primary key (userid)  
);  
drop table orders cascade constraints;
create table orders (  
    userid varchar2(20) not null,  
    ono number(5),  
    received date not null,  
    shipped date,  
    shipAddress varchar2(50),  
    shipCity varchar2(30),  
    shipState varchar2(20),  
    shipZip number(5),  
    primary key (ono),  
    foreign key (userid) references members  
);  
drop table odetails cascade constraints;
create table odetails (  
    ono number(5),  
    isbn char(10),  
    qty number(5) not null,  
    price number(7,2) not null,  
    primary key (ono,isbn),  
    foreign key (ono) references orders,  
    foreign key (isbn) references books  
);  
drop table cart cascade constraints;
create table cart (  
    userid varchar2(20),  
    isbn char(10),  
    qty number(5) not null,  
    primary key (userid,isbn),  
    foreign key (userid) references members,  
    foreign key (isbn) references books  
);  

The database consists of five tables:

1. Books: This table records information about the books on sale in the book store. Each book is classified under a “subject” to enable subject searches.
2. **Members:** This table records information about members of the application. Each member chooses their own user id and password at the time of registration.

3. **Orders:** This table records information about orders placed by members place orders. The orders may contain one or more books and the details of the order are kept in a separate table. A unique order number is generated by the system.

4. **OrderDetails:** This table records information about each order including the isbn and quantity of books in the order.

5. **Cart:** This table contains isbn and quantity of each book placed in the shopping cart of a member. Once a member checks out, the shopping cart is emptied and an order is created.

The book store application should be developed as a terminal application in Java and should be implemented in three phases:

**Phase I** of the project requires:

(a) Each student to create data for approximately 10 books for two different subjects (the subjects may be assigned by the instructor of the class to each student). The instructor may then consolidate the data into a large data set and give it out to the entire class. This is an easy way to create a large data set of books.

(b) Each student to build program the following interface implementing only the member registration and member login functions:

```
$ java OnlineBookStore

6. One Click Check Out

This option should move items in the cart to the order and odetails tables. Cart is emptied in the process and an invoice is printed. Shipping address is same as member address in this option.
User Interface follows:

Invoice for Order no.117

<table>
<thead>
<tr>
<th>ISBN</th>
<th>Title</th>
<th>$</th>
<th>Qty</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>0451191323</td>
<td>1,001 Baseball Questions Your Friends Can't Answer</td>
<td>22.45</td>
<td>1</td>

Press Enter to go back to Menu

Phase III of the project requires the student to implement the following member functions:

2. Search by Author/Title
   This option should provide 3 sub-options:
   1. Author Search
   2. Title Search
   3. Go Back to Member Menu
   In the Author or Title search sub-option, the user may enter a substring and the system should respond with all books which contain the substring in the title/author. The display should be done 2 books at a time on a screen.
   The system should also allow user to enter isbn to put in cart;
      to press ENTER to return to main menu
      to press n ENTER to continue browsing

User Interface follows:

1. Author Search
2. Title Search
3. Go Back to Member Menu

Type in your option: 2

Enter title or part of the title: cook
2 books found

Author: Irma S. Rambauer
Title: Joy of Cooking
ISBN: 0452279232
Price: 15.25
Subject Cooking

Author: Jennifer E. Darling
Title: Better Homes and Gardens New Cook Book
ISBN: 0696201887
Price: 21.96
Subject: Cooking

Enter ISBN to add to Cart or
Enter to browse or
n ENTER to return to menu: 0696201887
Enter quantity: 1

1. Author Search
2. Title Search
3. Go Back to Member Menu

Type in your option: 2

Enter title or part of the title: Computer
0 books found

Enter ISBN to add to Cart or
Enter to browse or
n ENTER to return to menu: n

1. Author Search
2. Title Search
3. Go Back to Member Menu

Type in your option: 1

Enter name or part of the name: am
1 books found

Author: Irma S. Rambauer

Enter quantity: 2

1. Author Search
2. Title Search
3. Go Back to Member Menu

Type in your option: 3

3. View/Edit Shopping Cart

This option should show the contents of the cart; It should then provide options to delete items or edit (change quantity) items. User Interface (for delete and update cart) follows:
Current Cart Contents:

<table>
<thead>
<tr>
<th>ISBN</th>
<th>Title</th>
<th>$</th>
<th>Qty</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>0696201887</td>
<td>Better Homes and Gardens New Cook Book</td>
<td>21.95</td>
<td>1</td>
<td>21.95</td>
</tr>
<tr>
<td>0452279232</td>
<td>Joy of Cooking</td>
<td>15.25</td>
<td>2</td>
<td>30.50</td>
</tr>
</tbody>
</table>

Total = $52.45

Enter d to delete item
e to edit cart or
q to go back to Menu: d

Enter isbn of item: 0452279232
Delete Item Completed
Press enter to go back to Menu

Type in your option: 3

<td>21.95 2 43.91</td>
</tr>
</tbody>
</table>

Total = $43.91

Press enter to go back to Menu

6.3 Online Shopping System

Using PhP and MySQL, implement a Web-based application for an online video-store. The online video-store maintains an inventory of DVDs. Customers become member of this online store. They are able to search for DVDs of their interest and add DVDs to their shopping cart. At any time, they are able to edit the shopping cart and also are able to check out. The initial login screen shown in the Figure 6.1 allows an existing customer to sign in or a new customer to register. The new customer registration screen is shown in Figure 6.2. Upon successful sign-in, the 3-frame page shown in Figure 6.3 is displayed. As one can see, there are six different options for the customer:

1. **Search by Keyword:** This option allows the customer to perform a keyword search of the DVD titles (substring; case insensitive comparison). Successful matches are shown on the right frame (Figure 6.4). The customer may then choose certain quantities of the DVDs and add them to the shopping cart. Upon successful addition to the shopping cart, a message should be shown on the right frame.

2. **View/Edit Cart:** Upon clicking this option, the system should display the shopping cart on the right side frame (Figure 6.5). Here, the customer may edit the shopping cart by changing quantities including replacing a value with a zero. Upon submission, the cart should be updated and a message should be displayed.

3. **Update Profile:** This option brings up the customers profile (Figure 6.6) on the right frame. The user may modify any field and submit. Upon successful update, a message should be displayed.

4. **Check Order Status:** This option allows the customer to see all their orders (Figure 6.7). Upon clicking the order number link the details for that order should be displayed in a tabular format.

5. **Check Out:** Upon clicking this link, the system should empty the cart and move the items into the orders and odetails tables. An invoice (Figure 6.8) should be printed on the right frame.
6. **Logout:** Upon logout, the system should display 3 Options (Figure 6.9) to the user. The user may check out, save cart and logout or empty cart and logout. Upon checkout a similar action should take place as earlier. Upon the other two options, appropriate action should take place and a message should be displayed. If the cart was empty to begin with these 3 options should not be shown and the customer should be logged out.

The database schema for the online shopping cart example is shown below:

```
create table parts(
    pno integer(5) not null,
    pname varchar(30),
    qoh integer,
    price decimal(6,2),
    olevel integer,
    primary key (pno));
create table customers (
    cno integer(10) not null auto_increment=100,
    cname varchar(30),
    street varchar(50),
    city varchar(30),
    state varchar(30),
    zip integer(5),
    phone char(12),
    email varchar(50),
    password varchar(15),
    primary key (cno));
create table cart(
    cartno integer(10) not null auto_increment,
    cno integer(10) not null,
    pno integer(5) not null,
    qty integer,
    primary key (cartno, pno),
    foreign key (cno) references customers,
    foreign key (pno) references parts);
create table orders (
    ono integer(5) not null auto_increment=1000,
    cno integer(10),
    received date,
    shipped date,
    primary key (ono),
    foreign key (cno) references customers);
create table odetails (
    ono integer(5) not null,
    pno integer(5) not null,
    qty integer,
    primary key (ono,pno),
    foreign key (ono) references orders,
    foreign key (pno) references parts);

Figure 6.8: Web Shopping – Check Out
6.4 Online Bulletin Board System

Using PhP and MySQL implement an online bulletin board system that allows a set of authorized users to participate in an online discussion forum. The data for the bulletin board system should be stored in a MySQL database with the following schema:

```sql
create table bbusers (  
    email varchar(50),  
    name varchar(30),  
    password varchar(10),  
    nickname varchar(30),  
    primary key (email)  
);  

create table postings (  
    postId integer(5) auto_increment,  
    postDate datetime,  
    postedBy varchar(50),  
    postSubject varchar(100),  
    content varchar(512),  
    ancestorPath varchar(100),  
    primary key (postId),  
    foreign key (postedBy) references bbusers  
);  
```
The database has two tables:

1. **bbusers**: This table records information about users of the bulletin board. The email and password fields are used for signing into the system.

2. **postings**: This table records information about all postings as well as follow-up postings of the bulletin board. Each posting is assigned a unique postId. To keep track of the “tree-structure” generated by follow-up postings, the system keeps track of the path from root message to the posting in the ancestorPath attribute. The path is recorded as a colon separated list of posting Ids; for example the ancestor path 1:5:6:12 would indicate that the current posting has a parent posting with postId=12, a grand-parent posting with postId=6, a great-grand-parent with postId=5, and a great-great-grandparent with postId=1. With this structure, the entire bulletin board messages can be viewed as a collection (forest) of trees.

The Web application should implement the following basic functions:

2. Default display of messages in reverse chronological order and properly indented follow-up messages.
3. Post message and post follow-up message by user.

Figure 6.10 and 6.11 show possible user interfaces for the main display page and the follow-up display page.
Figure 6.10: Bulletin Board – Main Display Page
Figure 6.11: Bulletin Board – Follow-up Listing Page
